## NeoColab\_REC\_CS23221\_Python Programming

### REC\_Python\_Week 6\_MCQ

Attempt : 1  
Total Mark : 20  
Marks Obtained : 19

#### Section 1 : MCQ

1. What is the purpose of the except clause in Python?

**Answer**

To handle exceptions during code execution

**Status : Correct**

**Marks : 1/1**

2. What happens if an exception is not caught in the except clause?

**Answer**

The program will display a traceback error and stop execution

**Status : Correct**

**Marks : 1/1**

3. Fill in the blanks in the following code of writing data in binary files.

```
import _____ (1)
rec=[]
while True:
    rn=int(input("Enter"))
    nm=input("Enter")
    temp=[rn, nm]
    rec.append(temp)
    ch=input("Enter choice (y/N)")
    if ch.upper=="N":
        break
f.open("stud.dat","_____")(2)
_____.dump(rec,f)(3)
_____.close()(4)
```

**Answer**

(pickle,wb,pickle,f)

**Status : Correct**

**Marks : 1/1**

4. What happens if no arguments are passed to the seek function?

**Answer**

error

**Status : Wrong**

**Marks : 0/1**

5. What is the difference between r+ and w+ modes?

**Answer**

in r+ the pointer is initially placed at the beginning of the file and the pointer is at the end for w+

**Status : Correct**

**Marks : 1/1**

6. How do you create a user-defined exception in Python?

**Answer**

By creating a new class that inherits from the Exception class

**Status :** Correct

**Marks :** 1/1

7. How do you rename a file?

**Answer**

`os.rename(existing_name, new_name)`

**Status :** Correct

**Marks :** 1/1

8. What is the output of the following code?

```
try:
    x = 1 / 0
except ZeroDivisionError:
    print("Caught division by zero error")
finally:
    print("Executed")
```

**Answer**

Caught division by zero errorExecuted

**Status :** Correct

**Marks :** 1/1

9. What is the output of the following code?

```
class MyError(Exception):
    pass

try:
    raise MyError("Something went wrong")
except MyError as e:
    print(e)
```

**Answer**

Something went wrong

**Status :** Correct

**Marks :** 1/1

10. What is the output of the following code?

```
try:  
    x = "hello" + 5  
except TypeError:  
    print("Type Error occurred")  
finally:  
    print("This will always execute")
```

**Answer**

Type Error occurredThis will always execute

**Status :** Correct

**Marks :** 1/1

11. What is the correct way to raise an exception in Python?

**Answer**

raise Exception()

**Status :** Correct

**Marks :** 1/1

12. Match the following:

- a) f.seek(5,1) i) Move file pointer five characters behind from the current position
- b) f.seek(-5,1) ii) Move file pointer to the end of a file
- c) f.seek(0,2) iii) Move file pointer five characters ahead from the current position
- d) f.seek(0) iv) Move file pointer to the beginning of a file

**Answer**

a-iii, b-i, c-ii, d-iv

**Status :** Correct

**Marks :** 1/1

13. Which of the following is true about the finally block in Python?

**Answer**

The finally block is always executed, regardless of whether an exception occurs or not

**Status :** Correct

**Marks :** 1/1

14. Which of the following is true about  
fp.seek(10,1)

**Answer**

Move file pointer ten characters ahead from the current position

**Status :** Correct

**Marks :** 1/1

15. Which clause is used to clean up resources, such as closing files in Python?

**Answer**

finally

**Status :** Correct

**Marks :** 1/1

16. Fill in the code in order to get the following output:

Output:

Name of the file: ex.txt

```
fo = open(____(1), "wb")  
print("Name of the file: ",____)(2)
```

**Answer**

1) "ex.txt" 2) fo.name

**Status :** Correct

**Marks :** 1/1

17. What will be the output of the following Python code?

```
f = None
for i in range (5):
    with open("data.txt", "w") as f:
        if i > 2:
            break
print(f.closed)
```

**Answer**

True

**Status :** Correct

**Marks :** 1/1

18. What is the default value of reference\_point in the following code?

```
file_object.seek(offset [,reference_point])
```

**Answer**

0

**Status :** Correct

**Marks :** 1/1

19. Fill the code to in order to read file from the current position.

Assuming exp.txt file has following 3 lines, consider current file position is beginning of 2nd line

Meri,25

John,21

Raj,20

Ouptput:

['John,21\n','Raj,20\n']

```
f = open("exp.txt", "w+")  
_____(1)  
print _____(2)
```

**Answer**

1) f.seek(0, 1) 2) f.readlines()

**Status :** Correct

**Marks :** 1/1

20. What will be the output of the following Python code?

```
# Predefined lines to simulate the file content  
lines = [  
    "This is 1st line",  
    "This is 2nd line",  
    "This is 3rd line",  
    "This is 4th line",  
    "This is 5th line"  
]  
  
print("Name of the file: foo.txt")  
  
# Print the first 5 lines from the predefined list  
for index in range(5):  
    line = lines[index]  
    print("Line No %d - %s" % (index + 1, line.strip()))
```

**Answer**

Displays Output

**Status :** Correct

**Marks :** 1/1

## NeoColab\_REC\_CS23221\_Python Programming

### REC\_Python\_Week 6\_COD

Attempt : 1  
Total Mark : 50  
Marks Obtained : 50

### Section 1 : Coding

#### 1. Problem Statement

A retail store requires a program to calculate the total cost of purchasing a product based on its price and quantity. The program performs validation to ensure valid inputs and handles specific error conditions using exceptions:

Price Validation: If the price is zero or less, raise a ValueError with the message: "Invalid Price". Quantity Validation: If the quantity is zero or less, raise a ValueError with the message: "Invalid Quantity". Cost Threshold: If the total cost exceeds 1000, raise RuntimeError with the message: "Excessive Cost".

#### ***Input Format***

The first line of input consists of a double value, representing the price of a product.

The second line consists of an integer, representing the quantity of the product.

### **Output Format**

If the calculation is successful, print the total cost rounded to one decimal place.

If the price is zero or less prints "Invalid Price".

If the quantity is zero or less prints "Invalid Quantity".

If the total cost exceeds 1000, prints "Excessive Cost".

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 20.0

5

Output: 100.0

### **Answer**

```
class pr(Exception):
    pass
class qu(Exception):
    pass
class co(Exception):
    pass
try:
    p=float(input())
    q=int(input())
    if p<=0:
        raise pr
    if q<=0:
        raise qu
    c=p*q
    if c>1000:
        raise co
except pr:
    print("Invalid Price")
except qu:
```

```
print("Invalid Quantity")
except co:
    print("Excessive Cost")
else:
    print(c)
```

**Status :** Correct

**Marks : 10/10**

## 2. Problem Statement

Tara is a content manager who needs to perform case conversions for various pieces of text and save the results in a structured manner.

She requires a program to take a user's input string, save it in a file, and then retrieve and display the string in both upper-case and lower-case versions. Help her achieve this task efficiently.

File Name: text\_file.txt

### ***Input Format***

The input consists of a single line containing a string provided by the user.

### ***Output Format***

The first line displays the original string read from the file in the format: "Original String: {original\_string}".

The second line displays the upper-case version of the original string in the format: "Upper-Case String: {upper\_case\_string}".

The third line displays the lower-case version of the original string in the format: "Lower-Case String: {lower\_case\_string}".

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: #SpecialSymBoLs1234  
Output: Original String: #SpecialSymBoLs1234  
Upper-Case String: #SPECIALSYMBOLS1234  
Lower-Case String: #specialsymbols1234

**Answer**

```
with open("text_file.txt","w") as f:  
    f.write(input().strip())  
with open("text_file.txt","r") as f:  
    c=f.read()  
print("Original String: ",c)  
print("Upper-Case String: ",c.upper())  
print("Lower-Case String: ",c.lower())
```

**Status :** Correct

**Marks : 10/10**

### 3. Problem Statement

Sophie enjoys playing with words and wants to count the number of words in a sentence. She inputs a sentence, saves it to a file, and then reads it from the file to count the words.

Write a program to determine the number of words in the input sentence.

File Name: sentence\_file.txt

**Input Format**

The input consists of a single line of text containing words separated by spaces.

**Output Format**

The output displays the count of words in the sentence.

Refer to the sample output for the formatting specifications.

**Sample Test Case**

Input: Four Words In This Sentence

Output: 5

**Answer**

```
with open("Sentence_file.txt","w") as f:
    f.write(input().strip())
with open("Sentence_file.txt","r") as f:
    con = f.read()
    count = sum(1 for i in con if i == ' ')
    count+=1
    if(count != 1):
        print(count)
    else:
        print("0")
```

**Status :** Correct

**Marks : 10/10**

#### 4. Problem Statement

Write a program that calculates the average of a list of integers. The program prompts the user to enter the length of the list (n) and each element of the list. It performs error handling to ensure that the length of the list is a non-negative integer and that each input element is a numeric value.

**Input Format**

The first line of the input is an integer n, representing the length of the list as a positive integer.

The second line of the input consists of an element of the list as an integer, separated by a new line.

**Output Format**

If the length of the list is not a positive integer or zero, the output displays "Error: The length of the list must be a non-negative integer."

If a non-numeric value is entered for the length of the list, the output displays "Error: You must enter a numeric value."

If a non-numeric value is entered for a list element, the output displays "Error: You must enter a numeric value."

If the inputs are valid, the program calculates and prints the average of the provided list of integers with two decimal places: "The average is: [average]".

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: -2

1  
2

Output: Error: The length of the list must be a non-negative integer.

### **Answer**

```
class L(Exception):
    pass
class E(Exception):
    pass
l=[]
try:
    n=input()
    try:
        n=int(n)
    except ValueError:
        raise E
    if int(n) <= 0:
        raise L
    for i in range(int(n)):
        e=input()
        if e.isdigit():
            l.append(int(e))
        else:
            raise E
    s=sum(l)
    print(f"The average is: {s/int(n):0.2f}")
except L:
    print("Error: The length of the list must be a non-negative integer.")
```

```
except E:  
    print("Error: You must enter a numeric value.")
```

**Status :** Correct

**Marks :** 10/10

## 5. Problem Statement

In a voting system, a person must be at least 18 years old to be eligible to vote. If a user enters an age below 18, the system should raise a user-defined exception indicating that they are not eligible to vote.

### *Input Format*

The input contains a positive integer representing age.

### *Output Format*

If the age is less than 18, the output displays "Not eligible to vote".

Otherwise, the output displays "Eligible to vote".

Refer to the sample output for formatting specifications.

### *Sample Test Case*

Input: 18

Output: Eligible to vote

### *Answer*

```
class S(Exception):  
    pass  
try:  
    n=int(input())  
    if n<18:  
        raise S  
    print("Eligible to vote")  
except S:  
    print("Not eligible to vote")
```

**Status :** Correct

**Marks :** 10/10

### REC\_Python\_Week 6\_PAH

Attempt : 1  
Total Mark : 30  
Marks Obtained : 30

### Section 1 : Coding

#### 1. Problem Statement

Peter manages a student database and needs a program to add students. For each student, Alex inputs their ID and name. The program checks for duplicate IDs and ensures the database isn't full.

If a duplicate or a full database is detected, an appropriate error message is displayed. Otherwise, the student is added, and a confirmation message is shown. The database has a maximum capacity of 30 students, and each student must have a unique ID.

#### ***Input Format***

The first line contains an integer  $n$ , representing the number of students to be added to the school database.

The next n lines each contain two space-separated values, representing the student's ID (integer) and the student's name (string).

### **Output Format**

The output will depend on the actions performed in the code.

If a student is added to the database, the output will display: "Student with ID [ID number] added to the database."

If there is an exception due to a duplicate student ID, the output will display: "Exception caught. Error: Student ID already exists."

If there is an exception due to the database being full, the output will display: "Exception caught. Error: Student database is full."

Refer to the sample outputs for the formatting specifications.

### **Sample Test Case**

Input: 3  
16 Sam  
87 Sabari  
43 Dani

Output: Student with ID 16 added to the database.  
Student with ID 87 added to the database.  
Student with ID 43 added to the database.

### **Answer**

```
class r(Exception):  
    pass  
class c(Exception):  
    pass  
try:  
    i=0  
    s=[]  
    n=int(input())  
    for i in range(n):
```

```

if i>=30:
    raise c
si=input().strip()
t=tuple(si.split())
q,na=t
if q in s:
    raise r
print("Student with ID",q,"added to the database.")
s.append(q)
i+=1
except r:
    print("Exception caught.Error: Student ID already exists.")
except c:
    print("Exception caught.Error: Student database is full.")

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

John is a data analyst who often works with text files. He needs a program that can analyze the contents of a text file and count the number of times a specific character appears in the file.

John wants a simple program that allows him to specify a file and a character to count within that file.

### **Input Format**

The first line of input consists of the file's name to be analyzed.

The second line of the input consists of the string they want to write within the file.

The third line of the input consists of a character to count within the file.

### **Output Format**

If the character is found, the output displays "The character 'X' appears {Y} times in the file." where X is the character and Y is the count,

If the character does not appear in the file, the output displays "Character not found."

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: test.txt

This is a test file to check the character count.

e

Output: The character 'e' appears 5 times in the file.

### **Answer**

```
f=input()
with open("f","w") as f:
    f.write(input().strip())
with open("f","r") as f:
    c = f.read()
    ch = input()
    co=c.lower().count(ch.lower())
    if co == 0:
        print("Character not found in the file.")
    else:
        print(f"The character '{ch}' appears {co} times in the file.")
```

**Status :** Correct

**Marks :** 10/10

### **3. Problem Statement**

Reeta is playing with numbers. Reeta wants to have a file containing a list of numbers, and she needs to find the average of those numbers. Write a program to read the numbers from the file, calculate the average, and display it.

File Name: user\_input.txt

### **Input Format**

The input file will contain a single line of space-separated numbers (as a string).

These numbers may be integers or decimals.

### **Output Format**

If all inputs are valid numbers, the output should print: "Average of the numbers is: X.XX" (where X.XX is the computed average rounded to two decimal places)

If the input contains invalid data, print: "Invalid data in the input."

Refer to the sample output for format specifications.

### **Sample Test Case**

Input: 1 2 3 4 5

Output: Average of the numbers is: 3.00

### **Answer**

```
with open("user_input.txt","w") as f:
    f.write(input().strip())
with open("user_input.txt","r") as f:
    s = f.read()
    try:
        l=list(map(float,s.split(" ")))
        print(f"Average of the numbers is: {sum(l)/len(l):0.2f}")
    except ValueError:
        print("Invalid data in the input.")
```

**Status :** Correct

**Marks :** 10/10

## NeoColab\_REC\_CS23221\_Python Programming

### REC\_Python\_Week 6\_CY

Attempt : 1  
Total Mark : 40  
Marks Obtained : 40

### Section 1 : Coding

#### 1. Problem Statement

Write a program to read the Register Number and Mobile Number of a student. Create user-defined exception and handle the following:

If the Register Number does not contain exactly 9 characters in the specified format(2 numbers followed by 3 characters followed by 4 numbers) or if the Mobile Number does not contain exactly 10 characters, throw an `IllegalArgumentException`. If the Mobile Number contains any character other than a digit, raise a `NumberFormatException`. If the Register Number contains any character other than digits and alphabets, throw a `NoSuchElementException`. If they are valid, print the message 'valid' or else print an Invalid message.

#### ***Input Format***

The first line of the input consists of a string representing the Register number.

The second line of the input consists of a string representing the Mobile number.

### **Output Format**

The output should display any one of the following messages:

If both numbers are valid, print "Valid".

If an exception is raised, print "Invalid with exception message: ", followed by the specific exception message.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 19ABC1001

9949596920

Output: Valid

### **Answer**

```
import re
def validate_register_number(reg_num):
    if len(reg_num) != 9:
        raise IllegalArgumentException("Register Number should have exactly 9
characters.")
    if not re.match(r'^\d{2}[A-Za-z]{3}\d{4}$', reg_num):
        raise IllegalArgumentException("Register Number should have the format: 2
numbers, 3 characters, and 4 numbers.")
    if not reg_num.isalnum():
        raise NoSuchElementException("Register Number should contain only digits
and alphabets.")
def validate_mobile_number(mobile):
    if len(mobile) != 10:
        raise IllegalArgumentException("Mobile Number should have exactly 10
characters.")
    if not mobile.isdigit():
        raise NumberFormatException("Mobile Number should only contain digits.")
class IllegalArgumentException(Exception):
    pass
```

```
class NoSuchElementException(Exception):
    pass

class NumberFormatException(Exception):
    pass

try:
    reg_num = input().strip()
    mobile = input().strip()
    validate_register_number(reg_num)
    validate_mobile_number(mobile)
    print("Valid")
except (IllegalArgumentException, NoSuchElementException,
        NumberFormatException) as e:
    print(f"Invalid with exception message: {e}")
```

**Status :** Correct

**Marks : 10/10**

## 2. Problem Statement

In the enchanted realm of Academia, you, the Academic Alchemist, are bestowed with a magical quill and a parchment to weave the grades of aspiring students into a tapestry of academic brilliance.

The mission is to craft a Python program that empowers faculty members to enter student grades for any two subjects, stores these magical grades in a mystical file, and then, with a wave of your virtual wand, calculates the GPA to unveil the true essence of academic achievement.

### ***Input Format***

The input format is a string representing the student's name, any two subjects, and corresponding grades.

After entering grades, they can type 'done' when prompted for the student's name.

### ***Output Format***

The output should display the (average of grades) calculated GPA with a precision of two decimal places.

The magical grades will be saved in a mystical file named "magical\_grades.txt".

Refer to the sample output for format specifications.

### **Sample Test Case**

Input: Alice

Math

95

English

88

done

Output: 91.50

### **Answer**

```
f=open("magical_grades.txt", "w")
while True:
    n=input()
    if n=="done":
        break
    s1=input()
    g1=int(input())
    s2=input()
    g2=int(input())
    a=(g1+g2)/2
    f.write(f"{n},{s1},{g1},{s2},{g2}\n")
    print(f"{a:.02f}")
f.close()
```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Alex is creating an account and needs to set up a password. The program prompts Alex to enter their name, mobile number, chosen username, and desired password. Password validation criteria include:

Length between 10 and 20 characters. At least one digit. At least one special character from !@#\$%^&\* set. Display "Valid Password" if

criteria are met; otherwise, raise an exception with an appropriate error message.

### ***Input Format***

The first line of the input consists of the name as a string.

The second line of the input consists of the mobile number as a string.

The third line of the input consists of the username as a string.

The fourth line of the input consists of the password as a string.

### ***Output Format***

If the password is valid (meets all the criteria), it will print "Valid Password"

If the password is weak (fails any one or more criteria), it will print an error message accordingly.

Refer to the sample outputs for the formatting specifications.

### ***Sample Test Case***

Input: John  
9874563210  
john  
john1#nhøj

Output: Valid Password

### ***Answer***

```
class l(Exception):  
    pass  
class d(Exception):  
    pass  
class c(Exception):  
    pass  
n=input()  
p=int(input())  
u=input()  
try:
```

```

pa=input().strip()
da,s=0,0
for i in pa:
    if i.isdigit():
        da+=1
    if i.isalnum():
        s+=1
if len(pa) <10 or len(pa)>=20:
    raise l
if not any(ch.isdigit() for ch in pa):
    raise d
if pa.isalnum():
    raise c
print("Valid Password")
except l:
    print("Should be a minimum of 10 characters and a maximum of 20
characters")
except d:
    print("Should contain at least one digit")
except c:
    print("It should contain at least one special character")

```

**Status :** Correct

**Marks : 10/10**

#### 4. Problem Statement

Alice is developing a program called "Name Sorter" that helps users organize and sort names alphabetically.

The program takes names as input from the user, saves them in a file, and then displays the names in sorted order.

File Name: sorted\_names.txt.

#### **Input Format**

The input consists of multiple lines, each containing a name represented as a string.

To end the input and proceed with sorting, the user can enter 'q'.

### **Output Format**

The output displays the names in alphabetical order, each name on a new line.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: Alice Smith

John Doe

Emma Johnson

q

Output: Alice Smith

Emma Johnson

John Doe

### **Answer**

```
with open("sorted_named.txt","w") as f:
```

```
    while True:
```

```
